

Figure S1. Meiosis II in wild type and the *incenp* mutant. Activated oocytes were immunostained for α -tubulin and D-TACC, and counterstained for DNA. In meiosis II, a pair of tandem spindles were formed in wild-type oocytes, while abnormal figures were observed in at least some of the mutant oocytes. In this case, one spindle has mis-segregated chromosomes and the other half has already formed a polar body structure. Bar=10 μ m.
